

Scientific Inquiry: The Scientific Method

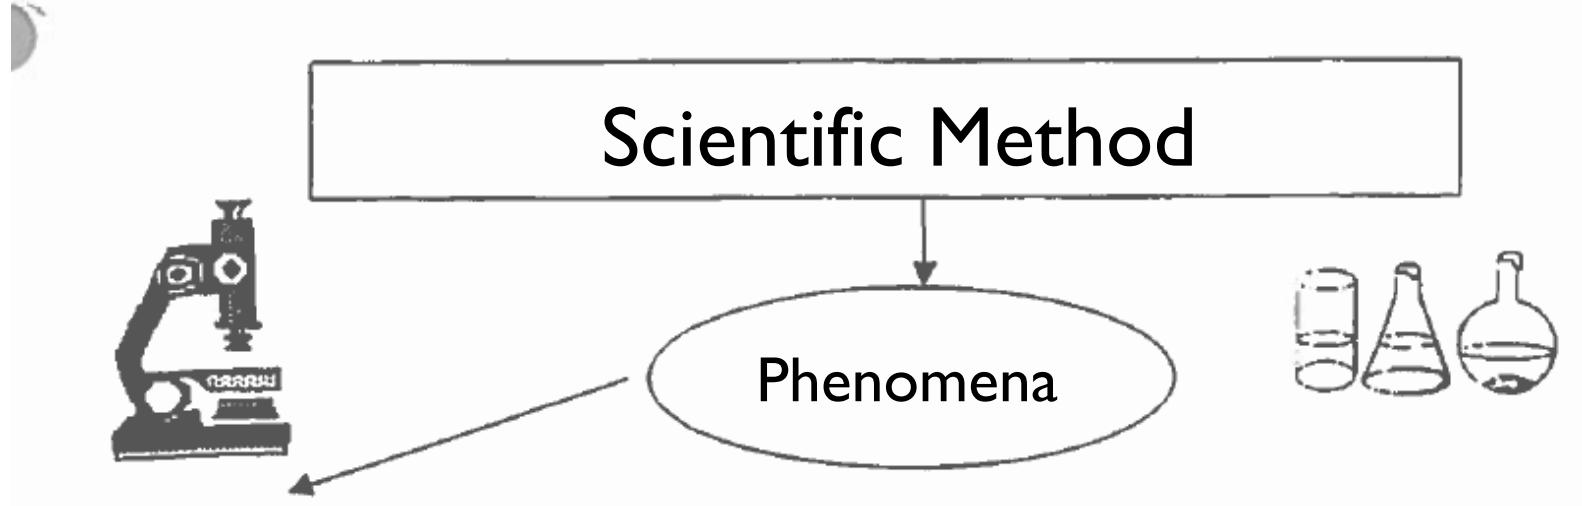

Chapter I: What is Life science?

I will be able to...

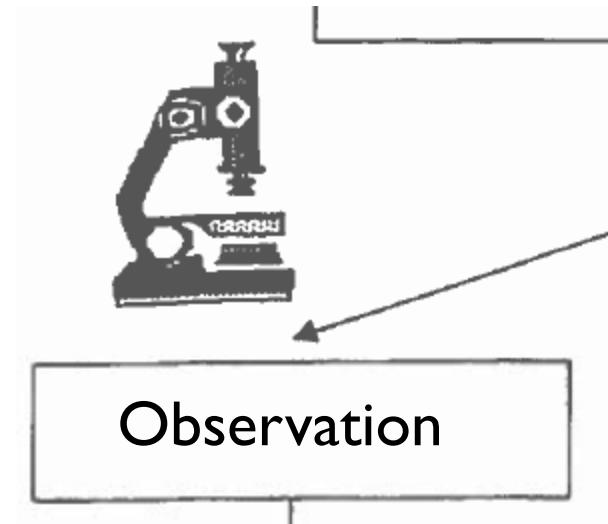

- Form a question around an laboratory activity
- Form a hypothesis using the “If..then” format
- Identify the independent and dependent of an experiment
- Follow the procedure and safety guidelines of the lab activity
- Analysis, interpret, and discuss data collected from the lab activity
- Form a conclusion from collected data

The Scientific Method

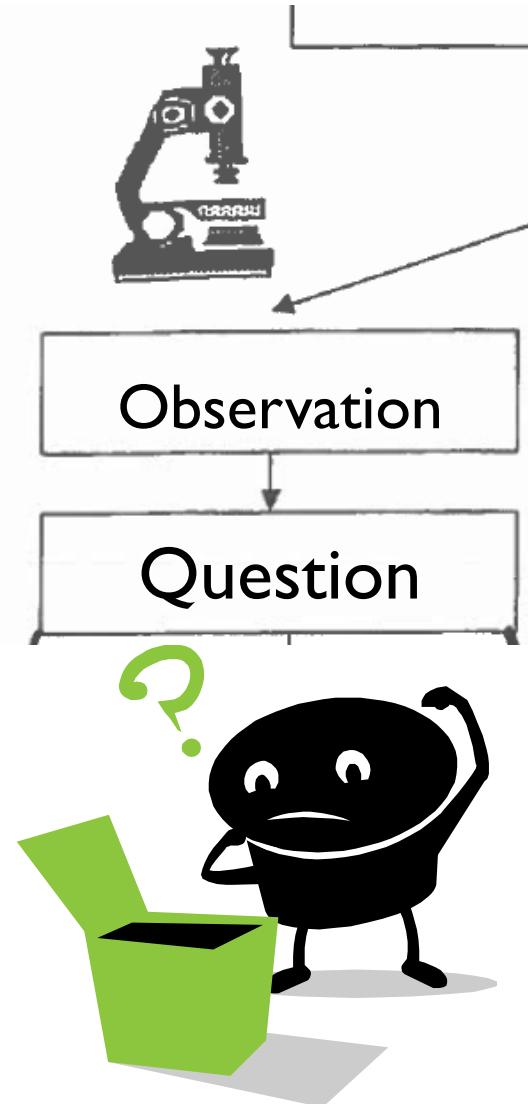

What is an observation?

- The act of using one's senses to describe the qualities and quantities of a phenomena

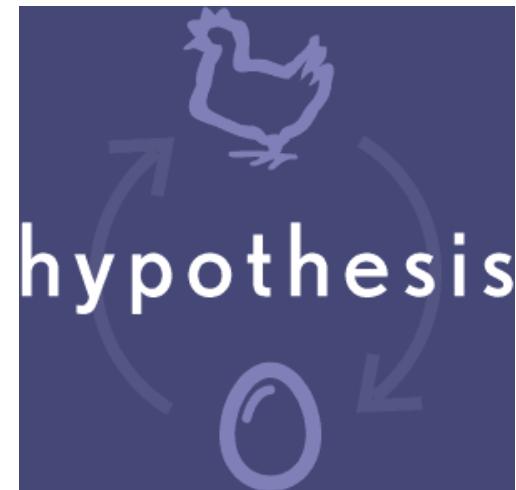

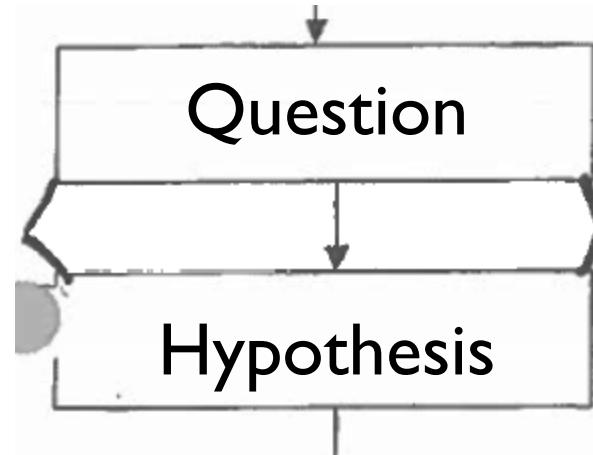

How do you form a question/problem?

- **What you want to find out (the objective or problem)**
- The question must be defined, measurable, testable, and controllable
- Testable questions have what and how

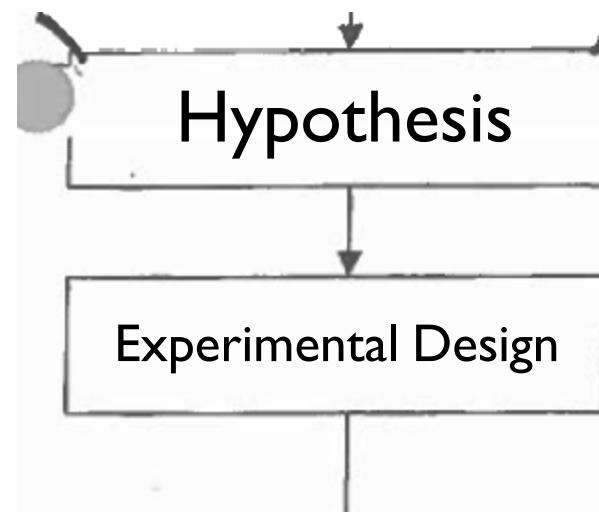

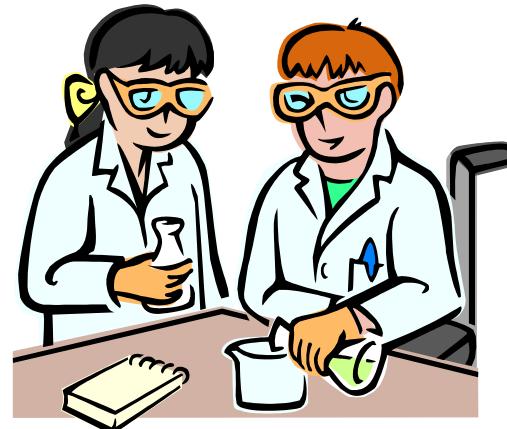

What is a hypothesis?

- An observed prediction or inference as an answer for the problem

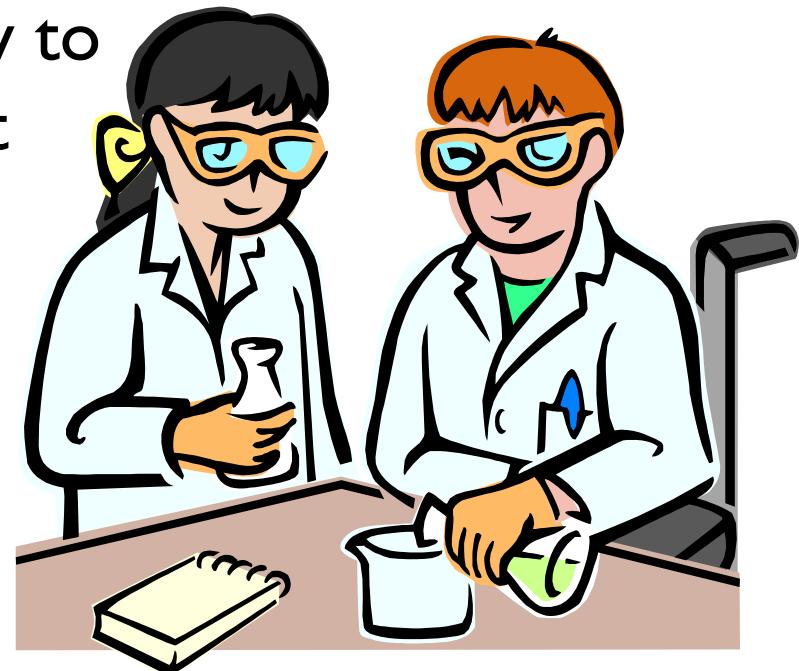

Experimental Design

- The steps and variables being tested and how they are being tested in a safe manner

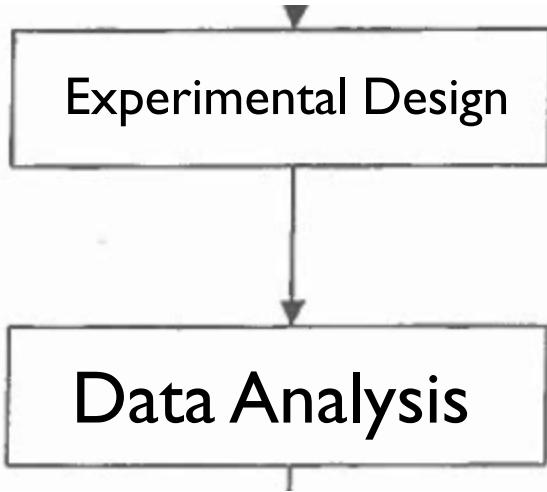

Experimental Design

- Procedure
 - **Detailed** steps to how to preform an experiment
- Materials
 - List of equipment used
- Lab Safety
- State your variables

Data Analysis

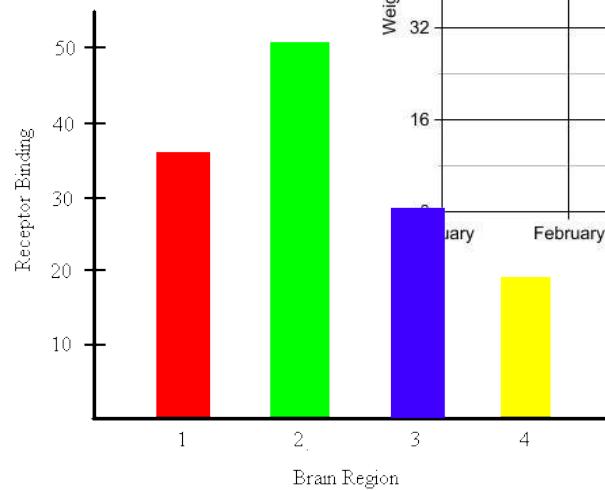

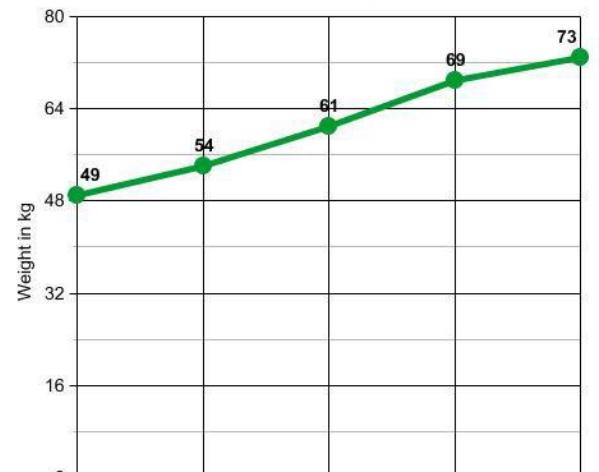

- Organize the data from the experiment into charts, tables, and graphs and analyze and interpret trends in the data.

Data Table for the Cart's Motion

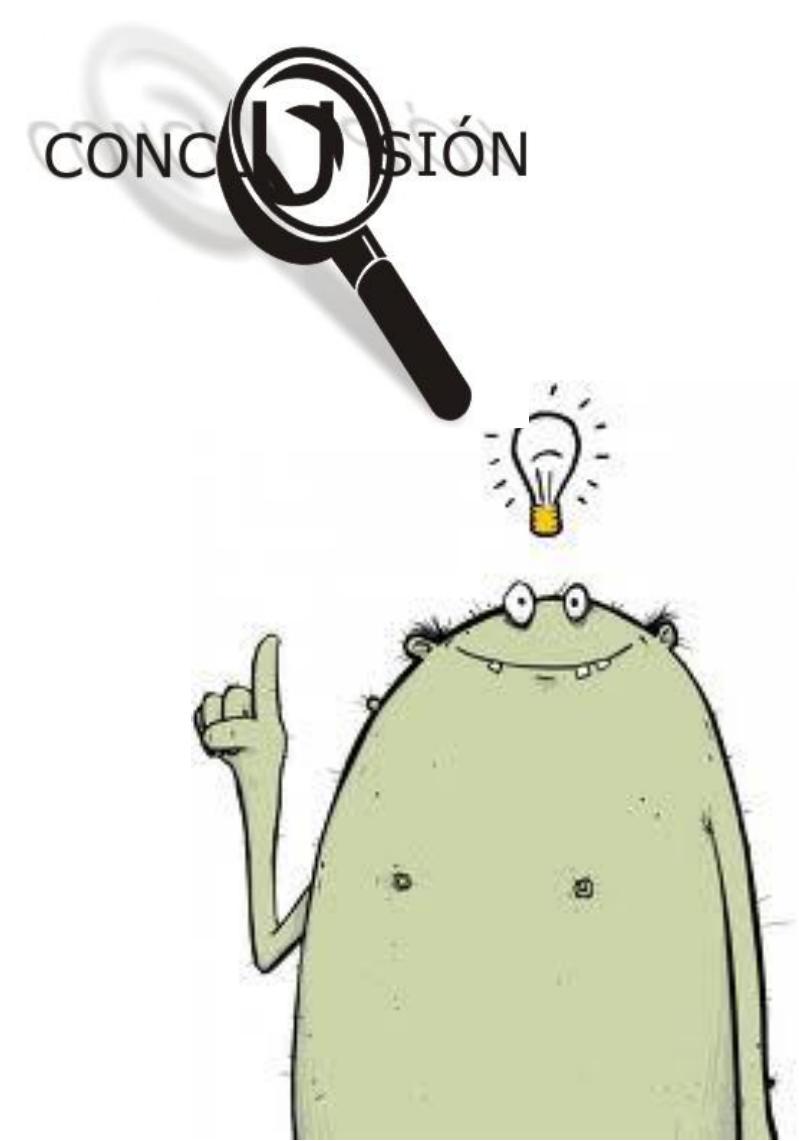

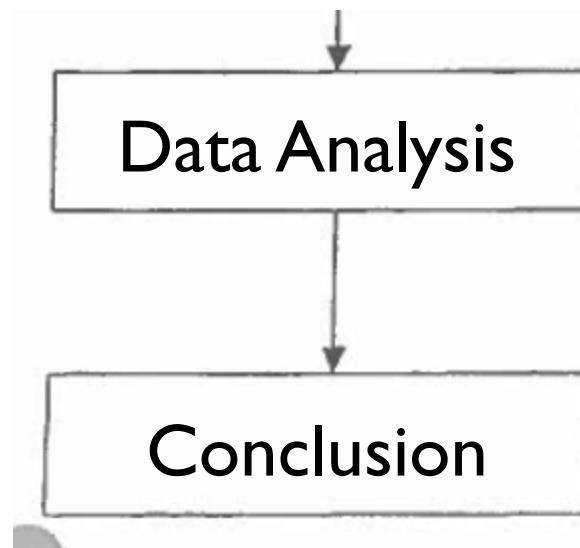

Trial	Time (s)	Position (cm)	Displacement (cm)	Ave. Velocity (cm/s)
1	0	0	—	—
2				
3				
4				
5				
6				
7				
8				
9				
10				

Sam's Weight

How do I write a conclusion?

- The answer to your problem and whether your data supports or not supports your hypothesis

What are the steps of the scientific method?

I. Make an observation

2. State the problem
and make a question

3. Form a hypothesis

4. List the materials,
variables, and create a
safe procedure

5. Collect Data

5. Interpret, analyze and
discuss results

6. Make a conclusion, revise, and repeat
