

The Periodic Table

Objective:

- To be able to identify different atoms by the number of protons in the nucleus and to realize that the number of electrons equals the number of protons in a neutral atom.
- To be able to explain the meaning of atomic number and atomic mass.

Each Box on the Periodic Table

- Proton

- Positively charged particle in the nucleus of the atom. The number of protons in an atom's nucleus is the atomic number

- Electron

- Negatively charged particle surrounding the nucleus of the atom. The number of electrons surrounding the nucleus of an atom is equal to the number of protons in the atom's nucleus.

- Neutron

- Particle in the nucleus that has about the same mass as a proton but has no charge. For the atoms of the first 20 elements, the number of neutrons is either equal to or slightly greater than the number of protons.

Activity:

- I have 100 cards (5 for each of the first 20 elements).
- Each card contains information about one of the first 20 atoms of the periodic table.
- Your job is to figure out which atom the card is describing and put the card at the correct spot.

Things to Consider

- What does the atomic number represents?
 - Amount of electrons and protons
- What does the atomic mass represent?
 - Amount of protons and neutrons
- How do we determine the amount of Neutrons in an atom?
 - $\text{Neutrons} = \text{Atomic Mass} - \text{Atomic Number}$

Card Placement

- Check 2-3 for accuracy
- Start filling out Periodic Table Elements 1-20 for:
 - Number of protons
 - Number of electrons
 - Number of neutrons (usually)

Key Concepts:

1. The **periodic table** is a chart containing information about **the atoms** that make up all **matter**.
2. An **element** is a substance made up of only one type of atom.
3. The **atomic number** of an atom is equal to the number of **protons** in its nucleus.
4. The number of **electrons** surrounding the nucleus of an atom is equal to the number of **protons** in its nucleus.

Key Concepts continued...

5. Different atoms of the same element can have a different number of **neutrons**.
6. Atoms of the same element with different numbers of neutrons are called **isotopes** of that element.
7. The **atomic mass** of an element is the average mass of the different isotopes of the element.
8. The atoms in the periodic table are arranged to show characteristics and relationships between **atoms** and **groups of atoms**.

Processing Activity:

- Pick one of the following atoms to draw:
 - Lithium
 - Beryllium
 - Fluorine
 - Sodium
